S/R & ambiguous grammars

- Lx(k) Grammar vs. Language
 - Grammar is Lx(k) if it can be parsed by Lx(k) method – according to criteria that is specific to the method.
 - A Lx(k) grammar may or may not exist for a language.
- Even if a given grammar is not LR(k), shift/reduce parser can *sometimes* handle them by accounting for ambiguities
 - Example: ‘dangling’ else
 - Preferring shift to reduce means matching inner ‘if’

Dangling 'else'

1. $S \rightarrow \text{if } E \text{ then } S$
2. $S \rightarrow \text{if } E \text{ then } S \text{ else } S$
 - Viable prefix “if E then if E then S”
 - Then read else
 - Shift “else” (means go for 2)
 - Reduce (reduce using production #1)
 - NB: dangling else as written above is ambiguous
 - NB: Ambiguity can be resolved, but there's still no LR(k) grammar

Precedence & Associativity

- Consider

$$E \rightarrow E - E \mid E * E \mid \text{id}$$

Reduce

id - id * id

Shift

id - id * id

Reduce

id - id - id

Precedence Relations

- Let $A \rightarrow w$ be a rule in the grammar
- And b is a terminal
- In some state q of the LR(1) parser there is a shift-reduce conflict:
 - either reduce with $A \rightarrow w$ or shift on b
- Write down a rule, either:
 $A \rightarrow w, < b$ or $A \rightarrow w, > b$

Precedence Relations

- $A \rightarrow w, < b$ means rule has less precedence and so we shift if we see b in the lookahead
- $A \rightarrow w, > b$ means rule has higher precedence and so we reduce if we see b in the lookahead
- If there are multiple terminals with shift-reduce conflicts, then we list them all:
 $A \rightarrow w, > b, < c, > d$

Precedence Relations

- Consider the grammar
$$E \rightarrow E + E \mid E * E \mid (E) \mid a$$
- Assume left-association so that $E+E+E$ is interpreted as $(E+E)+E$
- Assume multiplication has higher precedence than addition
- Then we can write precedence rules/relns:
$$E \rightarrow E + E, > +, < *$$
$$E \rightarrow E * E, > +, > *$$

Precedence & Associativity

10:

7:

$E \rightarrow E + E, > +, < *$
 $E \rightarrow E * E, > +, > *$

	$+$	$*$
7	R1	Shift
10	R2	R2
		8

Parsing - Summary

- Top-down vs. bottom-up
- Lookahead: FIRST and FOLLOW sets
- LL(1) – Parsing: $O(n)$ time complexity
 - recursive-descent and table-driven predictive parsing
- LR(k) – Parsing : $O(n)$ time complexity
 - LR(0), SLR(1), LR(1), LALR(1)
- Resolving shift/reduce conflicts
 - using precedence, associativity
